Package: team-site-full-width.sppkg · September 2026

INTRODUCTION

About this guide

Full Width Section lets you stretch any section of a SharePoint team site page across the full width of the page, with any web part inside it: Hero, Image, Quick links, Text, Embed and more.

This guide has two parts:

- **Part 1: Install**, for SharePoint admins and site owners (done once)
- **Part 2: Use on a page**, for page authors (every time you want a full-width section)

01

PART 1

Install

For SharePoint admins and site owners · done once

What you need

Step	Who can do it
Upload the app to the app catalog	SharePoint admin (or a site collection app catalog admin)
Add the app to a team site	Site owner of that team site

You also need the solution file `team-site-full-width.sppkg`.

Step 1: Upload the app to the app catalog

- 1 Go to the **SharePoint admin center** (<https://<your-tenant>-admin.sharepoint.com>).
- 2 Select **More features**, then under **Apps** select **Open**.
- 3 Select **Upload** and choose `team-site-full-width.sppkg`.
- 4 When prompted, select **Enable app**.

The app is now available to every site in your organisation, but it isn't active on any site yet.

Using a site collection app catalog?

Upload the file to the site's *Apps for SharePoint* library instead. The rest of the steps are the same.

Step 2: Add the app to your team site

- 1 Open the team site.
- 2 Select **Settings** (gear icon), then **Add an app**.
(Or go to **Site contents**, then **+ New**, then **App**.)
- 3 Find `team-site-full-width-client-side-solution` (the app published by KapiNex Private Ltd) and select **Add**.
- 4 Wait a few seconds for the app to appear in **Site contents**.

This turns on the Full Width Section extension for the site and adds the **Full Width Section** web part to the page toolbox.

Setting up more than one site?

Repeat Step 2 on each team site that needs full-width sections. If your admin deployed the app tenant-wide, skip this step. It is already active on every site.

02

PART 2

Make a section full width

For page authors · every time you want a full-width section

Step 1: Open the page in edit mode

- 1 Go to the page you want to change, or create one with **+ New**, then **Page**.
- 2 Select **Edit** at the top right of the page.

Step 2: Add a one-column section

- 1 Hover over the page where you want the section and select the **+** (**Add a new section**) icon on the left.
- 2 Choose **One column**.

Good to know

A one-column section gives the same result as the communication-site full-width layout. Multi-column sections also work: the whole section, with all its columns, is stretched.

Optional: add a background colour

Select **Edit section** (pencil icon) on the section's left toolbar and choose a **Section background**. The colour will stretch across the full width of the page.

Step 3: Add your content

Select the + inside the section and add the web parts you want to show at full width, for example:

- **Hero**, for a full-width banner with tiles or layers
- **Image**, for an edge-to-edge picture
- **Quick links, News, Events** or **Text**
- **Embed** or **Power BI**, for wide reports and videos
- Any custom web part

Step 4: Add the Full Width Section web part

- 1 Select the + inside the **same section**.
- 2 In the toolbox, search for **Full Width Section**. It is also listed under **Advanced** when you select **See all web parts**.
- 3 Select it. A dashed box appears with the message:
"Full width section. This section will stretch across the full width of the page when the page is viewed."

You can place it above or below your other web parts. The position doesn't matter, and it's invisible to readers.

See a red warning in the box?

"The Full Width Section extension is not active on this site..." means the app hasn't been added to this site yet. Ask your site owner to complete [Part 1, Step 2](#).

Step 5 (optional): Remove the side padding

By default the section keeps a small margin on the left and right, like other sections. For content that runs fully from edge to edge (banners, images, videos):

- 1 Select the Full Width Section web part.
- 2 Select **Edit web part** (pencil icon) to open the property pane.
- 3 Under **Layout**, turn on **Remove side padding (edge-to-edge content)**.
- 4 Close the property pane.

Step 6: Publish and check the result

- 1 Select **Republish** (or **Publish** for a new page).

- 2 The page switches to view mode and the section now spans the full width of the page content area.

Why does the section look normal while editing?

Full-width sections keep their normal width in edit mode, so the section toolbar stays within reach. The full width appears as soon as you publish or preview the page.

REFERENCE

Changing or removing a full-width section

To...	Do this
Turn edge-to-edge on or off	Edit the page, then open the Full Width Section web part's property pane and switch Remove side padding .
Make the section normal width again	Edit the page, delete the Full Width Section web part from that section and republish.
Make another section full width	Add a separate Full Width Section web part to that section. Use one per section.
Turn off the feature for the whole site	Site owner: go to Site contents , open the app's ... menu and select Remove . Sections go back to normal width. The marker web parts stay on the pages but have no effect.

BEST PRACTICE

Tips for best results

- **Use one Full Width Section web part per section.** Adding more to the same section has no extra effect.
- **Use wide images.** Full-width sections can be 1,600 px or wider on large screens, so use images at least 1,920 px wide to keep them sharp.
- **Text reads best at normal width.** Very long lines are hard to read. Keep long text in normal sections and use full width for banners, images and visuals.
- **Don't use it in a vertical section.** Place the web part in regular (horizontal) sections only.
- **Check on mobile.** Full-width sections resize automatically. Preview the page on a phone or a narrow browser window to confirm your images still look good.

HELP

Troubleshooting

Problem	Solution
I can't find the Full Width Section web part in the toolbox.	The app hasn't been added to this site. Ask the site owner to complete Part 1, Step 2 .
The web part shows a red "extension is not active" warning.	Same as above. If the app was just added, refresh the page.
The section is not full width after publishing.	Refresh the page (Ctrl + F5). Check that the Full Width Section web part is in the same section as your content.
The section is full width, but content still has margins.	Turn on Remove side padding in the web part's property pane. Some web parts, such as Text, also limit their own width by design.
The section looks normal in edit mode.	This is expected. Publish or preview the page to see the full width.
Only the Banner web part is offered in my full-width column.	That is SharePoint's built-in full-width column, which accepts only a few web parts. Use a normal One column section with the Full Width Section web part instead (see Part 2).

Frequently asked questions

Do readers see the Full Width Section web part?

No. It's only visible to authors while editing the page.

Does it change my page content?

No. It only changes how the section is displayed. Removing the web part restores the normal layout.

Does it work on communication sites?

Yes. It's designed for team sites, but works on communication sites as well.

Does it work with the team site's left navigation?

Yes. The section fills the page area next to the navigation and adjusts when the navigation is collapsed or expanded.

Does it need custom scripts to be enabled?

No. It works with the SharePoint Online default settings.
